Title: Perfect score: Sequence: US-09-544-665-4 29

Run on:

March 18, 2002, 09:52:26; Search time 24.53 Seconds (without alignments) 8.968 Million cell updates/sec

Scoring table: 1 REIIMD 6

BLOSUM62 Gapop 10.0 , Gapext 0.5 100059 seqs, 36664827 residues

Total number of hits satisfying chosen parameters:

100059

Minimum DB seq length: 0
Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt\_39:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Primary structure of Neurospora crassa gamma-tubulin.";

"Primary structure of Neurospora crassa gamma-tubulin.";

Gene 199:303-309(1997).

1. FUNCTION: TUBULIN IS THE MAJOR CONSTITUENT OF MICROTUBULES.

GAMMA TUBULIN IS FOUND AT MICROTUBULE ORGANIZING CENTERS (NTOC.)

SUCH AS THE SPINDLE POLES OR THE CENTROSOME, SUGGESTING THAT IT IS INVOLVED IN THE MINUS-END NUCLEATION OF MICROTUBULE ASSEMBLY.

1. SIMILARITY: BELONGS TO THE TUBULIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                   Rickettsia prowazekii.

1- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.

1- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION WILL OCCUR,
THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR,
AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO
BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).

1- SUBBURIT: AGGREGATE TO FORM A RING-LIKE STRUCTURE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EMBL; AJ235271; CAA14723.1; -.

```
is the number of results predicted by chance to have a ster than or equal to the score of the result being printed, rived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GenCore version 4.5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides AAY01812-14 exemplify the peptide of the invention, which is used in a peptide composition to affect a biological process characterized by abnormal cell migration through a physiological barrier, to inhibit PAI-1-dependent adhesion of a cell to a tissue, to promote clearance of scuPA from the surface of a mammalian cell, and to impede pathological migration of a cell in a mammal. The composition can be used to affect a biological process characterized by abnormal cell migration through a physiological barrier, where the process is selected from anglogenesis, organogenesis, oventation, inflammation, cancer, tumor cell invasion and metastasis, and atherosclerosis.
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of $602$ nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 5'-end sequence which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide comprises a 5'-end sequence complementary to the comprise complementary to the comprise and an oligonal comprise complementary to the comp
                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03165 to AAH13628 and AAH13631 to AAH18742 represent human cDNA sequences; AAB92446 to AAB9593 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                  The present sequence represents a ubiquitin-protein ligase called The Ubrl enzymes are involved in protein ubiquitinylation and ultimate degradation through the N-end rule pathway and have been linked to stress-related muscle wasting. Recombinant Ubrl polypept can be used to screen for inhibitors of muscle wasting when this i associated with the N-end rule pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ubiquitin-protein ligase; Ubrl; mouse; N-end rule pathway; stress-related musc

                                                                                                                                                                                                             The present sequence represents a murine Ubrl enzyme. Ubrl is an E3-type protein of the ubiquitin system. Specifically, it is a ubiquitin protein ligase. The enzyme is specific for destabilising residues exposed at the N-terminus of protein substrates. Inhibition of the expression of Ubrl gene in a cell results in inhibition of the N-end rule pathway. The method is used for treatment of mammalian cells infected with an intracellular pathogen, e.g. Lysteria monocytogenes or Yersinia entercolitics. Inhibition of N-end rule pathway is also useful for
                                                                                                                                                                                                                                                                                                                     Inhibiting the N-end rule pathway in mammalian cells for treating infections and various diseases associated with muscle tissue wasting, by inhibiting the expression of Ubrl gene

New chimaeric genes comprise a monocotyledonous plant promoter linked to a modified nucleic acid sequence derived from the MDMV-B genome. The modification is such that mRNA is translated to a truncated protein (pref. smaller than 200 amino acids), no translation of mRNA occurs or the transcribed mRNA lacks the translation initiation codon or includes a premature stop codon. Expression of the chimaeric gene inhibits infection of plants (pref. sorghum, sugarcane, esp. maize) by MDMV. The transgenic plants display an inheritable resistance trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 20; Page 31-44; 64pp; English

Expression of (1) in a microorganism inhibits proliferation of the microorganism, and the manufactured antibiotic is useful for reducing the activity or level of a gene product required for proliferation of a microorganism in a subject, specifically humans. The nucleic acids that inhibit bacterial growth or proliferation can be used as antisense therapeutics for killing bacteria. In addition to therapeutic applications, the nucleic acid sequences complementary to sequences required for proliferation can be used as diagnostic tools. For example, nucleic acid probes complementary to proliferation required sequences that are specific for particular species of microorganisms can be used as probes to identify particular microorganism species in clinical specimens. AAH81295 to AAH81487 encode the Escherichia coli proteans given in AAG89239 to AAK894431, and AAH81488 to AAH81491 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence (I) consisting essentially of one of the 93 nucleotide sequences given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in
           This novel protein may be used to treat tumors of the CNS in mammal by inhibiting the overexpression of the leucine zipper protein-kinase in vivo, or by interfering with a vital signal in a chain of signals leading to tumorigenicity.
                                                                                                                          DNA encoding novel leucine zipper polypeptide(s) prepared using the hyper-proliferation of CNS cells
                                                                                                                                                                                            WPI; 1995~320565/41.

The invention relates to a human interleukin (IL)-1 alpha propiece polypeptide. The polypeptide has activity in the selective induction of apoptosis in cancer cells. The IL-1 alpha propiece polypeptide or its variants which retain the apoptosis-inducing activity are used in compositions and methods to selectively induce apoptosis in cancer cells, especially manignant cancer cells. The polypeptides form the basis for especially manignant cancer cells where apoptosis-inducing agents
                                                                                                                        New polypeptides comprising an apoptosis-inducing domain and a heterologous nuclear localisation sequence - useful for, e.g. forming compositions and methods for selectively inducing apoptosis in cancer cells
                                                                                                                                                                                                                                                        27-MAY-1998;

                                                      Tn5401 is present in B.t. var. morrisoni strain E0218 (NRL-B-18213). E02158 was transformed with donor plasmid pE0911 and recombinant plasmids were analyzed. 2 Contained a 5 kb insert (given in AAQ85492) including 2 ORFs encoding a resolvase (AAR69825) and a transposase (AAR75354). Tn5401 is used in site-specific recombination to construct improved B.t. strains for biological

This sequence represents a Streptococcus pneumoniae protein of the cinvention. The proteins (or their homologues, derivatives and/or cragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in compositions comprising the proteins are useful as vaccines and also in conditions. The sequences are useful for the detection or diagnostic assays The sequences are useful for the detection or characteristic of S. pneumoniae infection, by contacting a sample to be tested composition or expression of the protein or polypeptide are useful in the function or expression of the protein or polypeptide are useful in compositions in the treatment or prophylaxis of S. pneumoniae infection, as the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in conjugation of the protein of the proteins with predisposing conditions can be applied to treat bacterial pneumonia, which has high rates in conjugation of the composition of the protein of the proteins with predisposing conditions can be used to treat bacterial pneumonia, which has high rates in composition of the protein of the prot
